

INBOUND RECEIVING SUMMARY

Inbound receiving begins when a vehicle books in at the gate. The gate clerk records the vehicle registration, the carrier name and the seal number shown on the trailer door. A consignment arriving without an intact seal is held for inspection and the shift lead is notified before unloading starts.

Unloading is scheduled against a dock appointment. Where a vehicle arrives outside its window the clerk offers the next free slot rather than turning the vehicle away, and the delay is recorded so that carrier performance can be reviewed each month.

Quality disposition happens after the physical count is agreed. A sample is drawn according to the lot size table and inspected against the specification held for that product. Anything outside specification is quarantined in the hold area and never placed into pickable stock.

Putaway follows disposition. The system proposes a location by product velocity, and the operator confirms the location by scanning it. A confirmed putaway closes the receipt and makes the stock available to picking on the next wave.
